

Did You Know?

1 COVID-19 has a **99.8% survival rate**.

2 Children are not at risk - statistically they have a **0% chance of dying** from COVID-19, much lower than their risk of dying from the flu.

3 In the U.S. the median age of death from COVID-19 is **78 years old**. 94% of deaths had underlying conditions, the average having more than two. 78% of people hospitalized were overweight or obese. For adults up to age 60, obesity was associated with nearly ALL the risk of intensive care or death.

4 Vitamin D deficiency accounts for almost **9 out of 10 COVID-19 deaths**.

5 Physicians across the country have been treating COVID-19 successfully for a year and a half.

6 **Ivermectin** is a safe, effective, and low-cost therapy that has been proven to greatly reduce deaths from COVID-19 and prevent cases from progressing to severe disease.

7 "**No shots, no school**" is not true. COVID-19 vaccination is NOT required for school attendance.

8 No COVID-19 vaccine is FDA approved. They are all under Emergency Use Authorization (EUA). According to federal law that means they are experimental and you have a **right to refuse**.

9 The PREP Act removes all liability for injury or death associated with COVID-19 vaccination - **you cannot sue**.

10 Employees can request a **religious exemption** for the COVID-19 vaccine under Title VII of the 1964 Civil Rights Act.

11 The mRNA technology in the Pfizer and Moderna vaccines is a novel gene therapy and has never been used in humans before. **Long-term effects are unknown**. You cannot fast track long-term studies.

12 Pfizer, Moderna, and Johnson & Johnson were granted EUA for their vaccines after providing only **2 months** of clinical trial data. Previously, the quickest vaccine ever developed was for mumps and that took 4 years.

We think you should know.

Did You Know?

- 13** COVID-19 vaccines were not tested on pregnant women; they did not test their effects on fertility in males/females. However, in Pfizer's rat studies the vaccinated female rats had a **2x increase in miscarriages** compared to unvaccinated rats. After sacrificing the vaccinated rats (male & female) they found the spike protein had accumulated in virtually all organs with the **highest concentration in the ovaries**. The implications of this for humans, what effects it can have on fertility, etc. are unknown.
- 14** In a recent study published in the New England Journal of Medicine, in the first 20 weeks of pregnancy, **82% of pregnant women receiving a COVID-19 vaccine had a miscarriage**.
- 15** Thousands of women across the world have complained of **altered menstrual cycles** following COVID-19 vaccination. Women can report their experience at mycyclestory.com.
- 16** All COVID-19 vaccines used **aborted fetal cells** in some way. Pfizer and Moderna vaccines were developed using the aborted fetal cell strain HEK293. The Johnson & Johnson vaccine is produced using the aborted fetal cell strain PER.C6.
- 17** COVID-19 vaccines **do not prevent infection, transmission, or decrease mortality**. The trials were not designed to prove if they could. Cases have occurred in populations with 100% vaccination rates.
- 18** COVID-19 vaccine trials could only claim the **vaccines effective for 2 months**.
- 19** Pfizer has announced the need for a **booster shot**, confirming the immunity acquired from the vaccine decreases rapidly and does not provide adequate protection from variants.
- 20** Immunity from natural COVID-19 infection is stronger and lasts longer than immunity acquired from COVID-19 vaccines. There is **zero benefit** to getting vaccinated if you have already had COVID-19.
- 21** There have been thousands of **deaths** following COVID-19 vaccination reported to the Vaccine Adverse Events Reporting System (VAERS), more than ALL vaccines combined.
- 22** There have been hundreds of thousands of **severe reactions** following COVID-19 vaccination reported to VAERS including Guillain-Barre Syndrome, blood clots, thrombocytopenia (low platelet count), anaphylaxis, shingles, among others.
- 23** According to reports from the CDC, COVID-19 vaccines dramatically increase - up to **200x** - the risk of **myocarditis** (inflammation of the heart) and **pericarditis** (inflammation of tissue surrounding the heart) in adults and children ages 12-49 years old, especially in males. Long-term effects of myocarditis can present decades later with premature onset of **heart failure**.

We think you should know.
